

To Rocky,
Best wishes,
your friend,
Isaac

Insane in the Membrane?

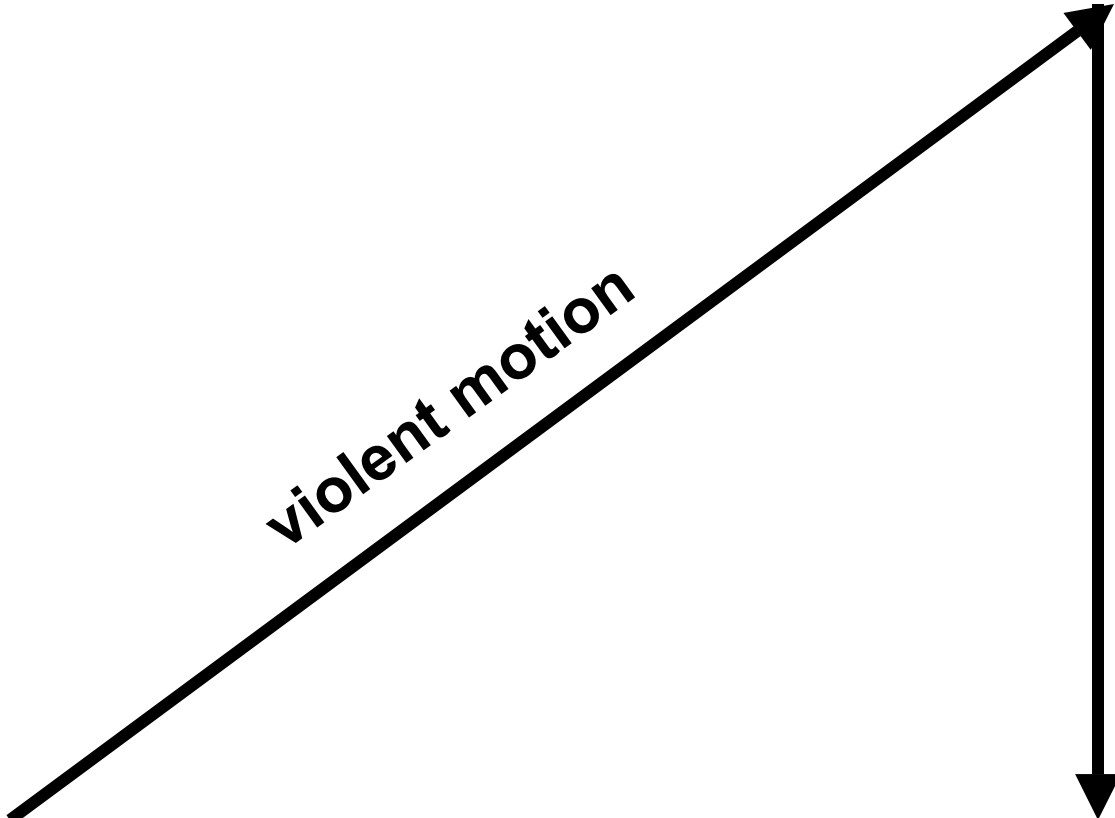

Lecture #4

April 26, 2003

Isaac Newton
1642-1727

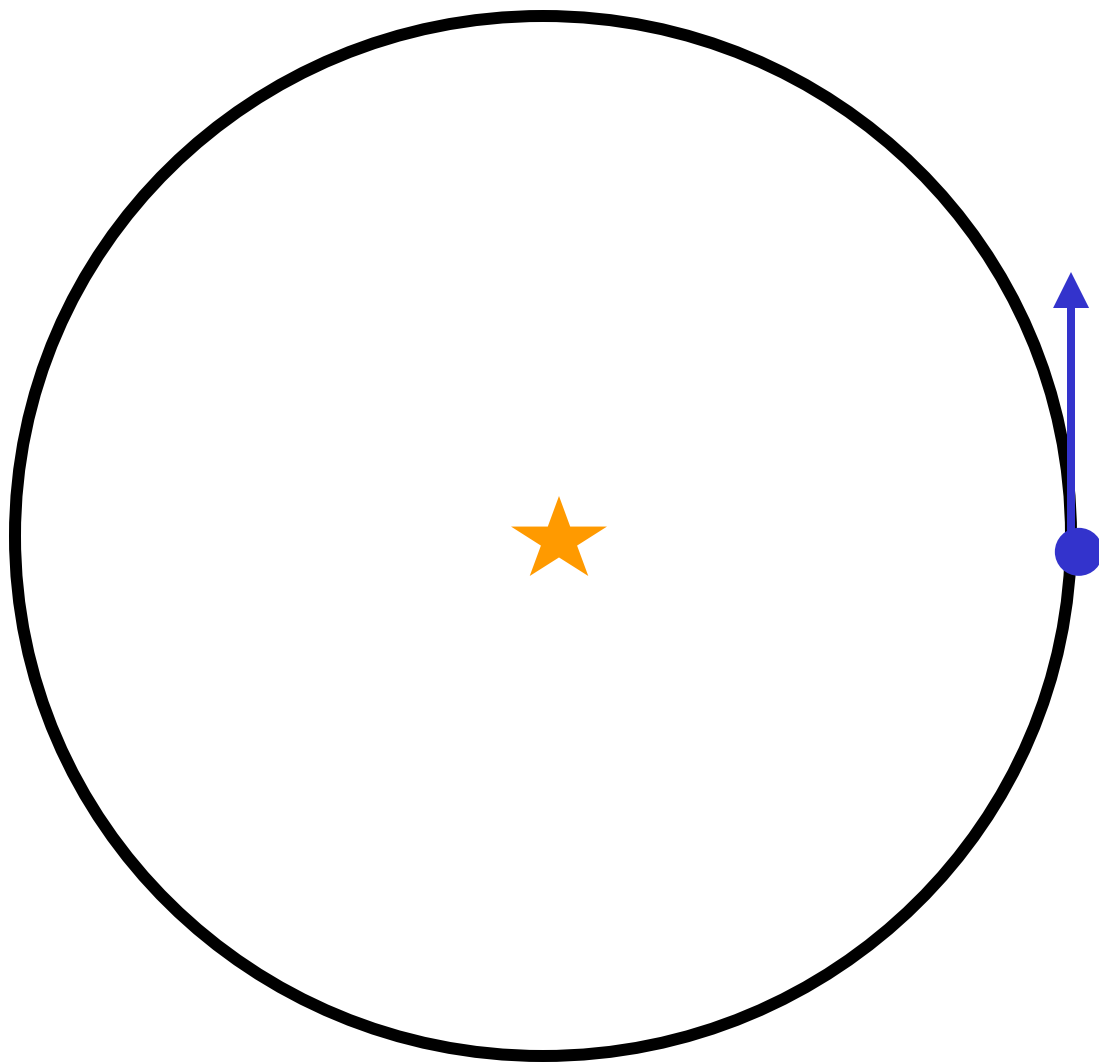

**Philosophiae
Naturalis
Principia
Mathematica**

- 1. Astronomers were doing more than “saving the appearances.”**
- 2. The same laws of physics operate on Earth as in the heavens.**
- 3. The heavens are comprehensible by humans.**
- 4. Crystalline spheres, mechanical gears, and other sundry devices were replaced with a simple mathematical force law.**
- 5. The physics of Aristotle and the astronomy of Ptolemy were relegated to the dust bin.**

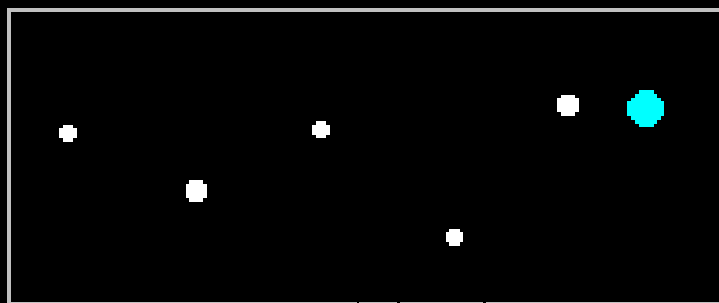

violent motion

natural motion

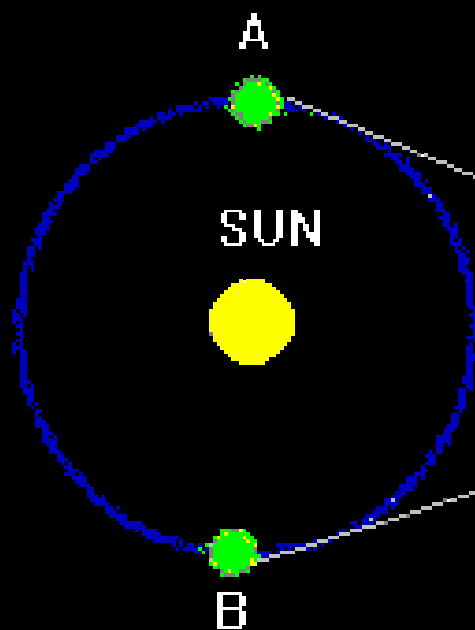

in absence of a force, planet would

- 1. slow to a stop?**
- 2. continue to orbit?**
- 3. fly off in a straight line?**

$$\tan \alpha = \frac{1 \text{ AU}}{D}$$

How good are your eyes?

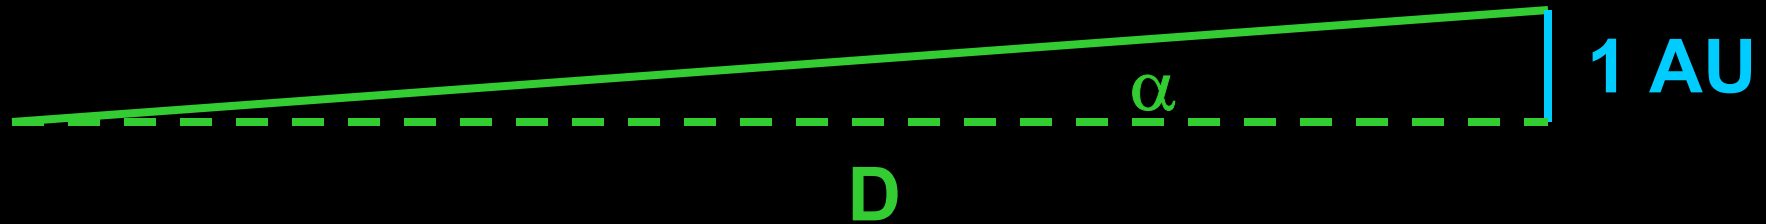

angle = $1/30$ of a degree

1 degree = 60 minutes of arc

1 minute of arc = 60 seconds of arc

$1/30$ of a degree = 2 minutes of arc

resolution of human eye about 1'

$$\alpha = \frac{1 \text{ AU}}{D} \text{ radians}$$

$$\alpha = \frac{206,264.8 \text{ AU}}{D} \text{ seconds}$$

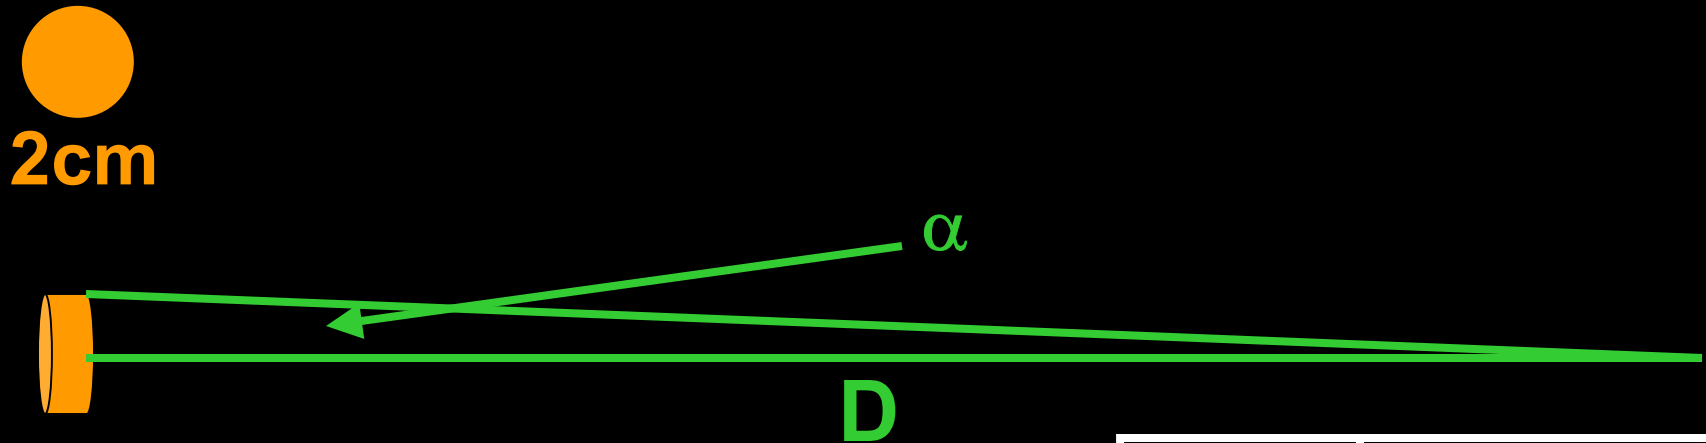

$$\alpha = \frac{1 \text{ pc}}{D} \text{ seconds}$$

$$\begin{aligned} 1 \text{ pc} &= 206,264.8 \text{ AU} = 3.26 \text{ light years} \\ &= 10^{13} \text{ (10,000,000,000,000) miles} \end{aligned}$$

$$\frac{d}{\text{pc}} = \frac{''}{\text{parallax}}$$

star	parallax (")	distance (pc)
α Centauri	0.75	1.3
Barnard's star	0.5	2.0
Sirius	0.4	2.5
Altair	0.2	5.0

Let's think for a second of arc

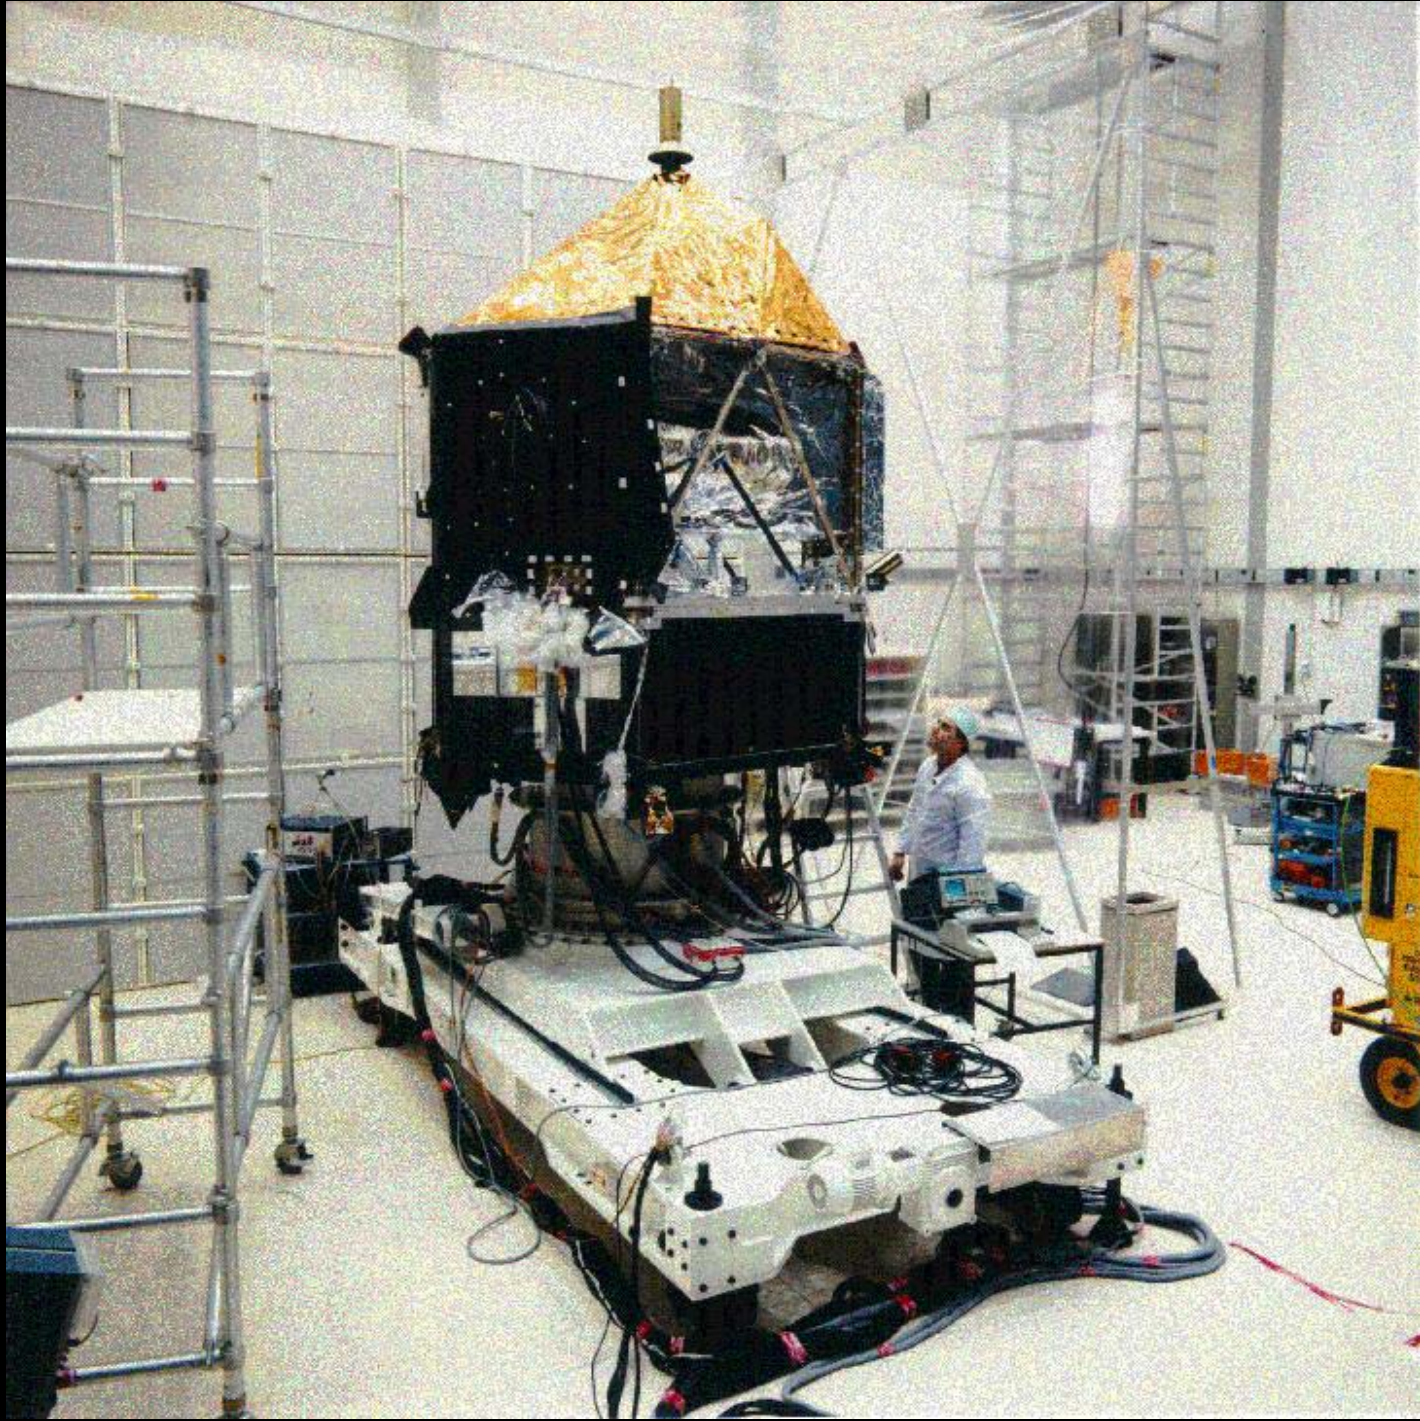

$$\alpha = \frac{1 \text{ cm}}{D} \text{ radians}$$

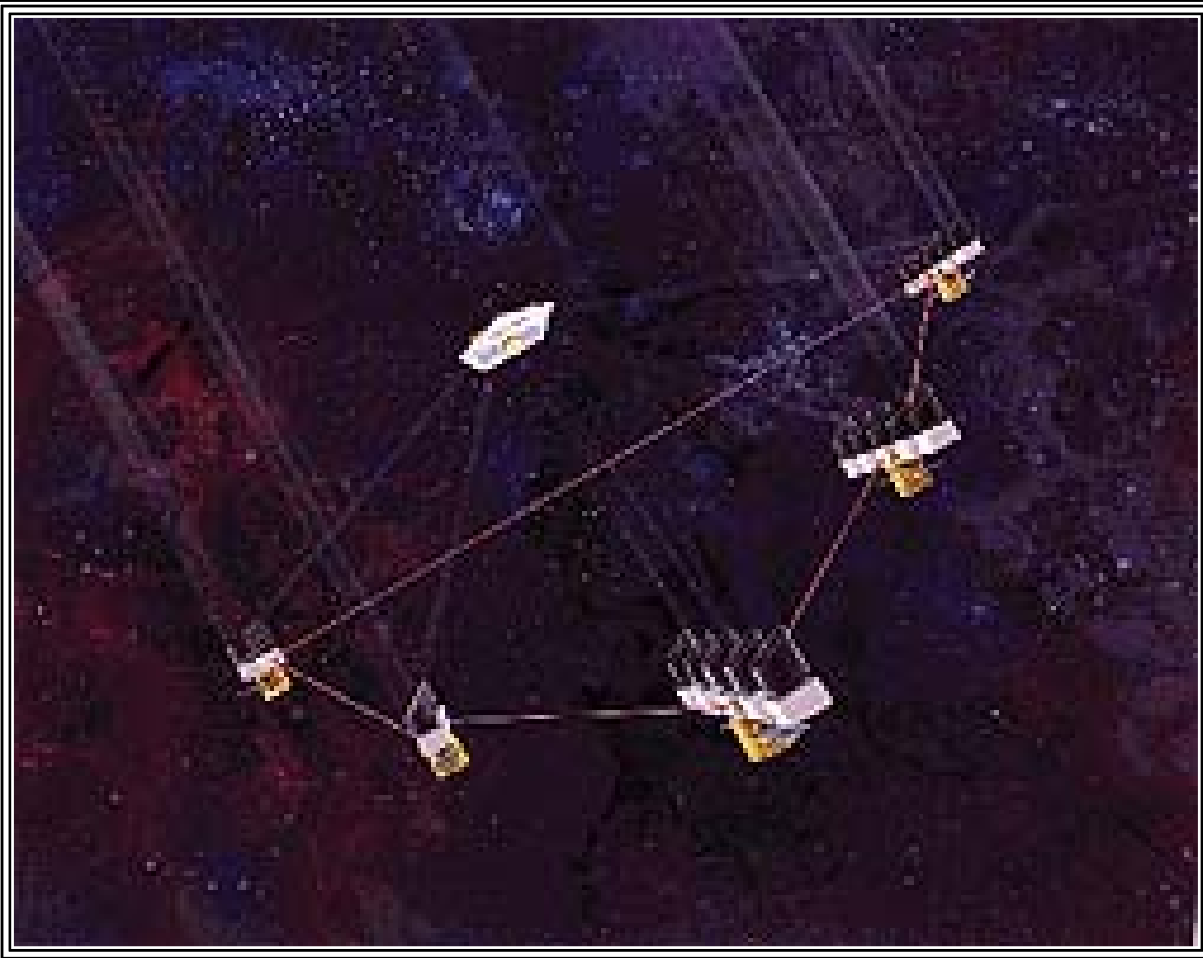

$$\alpha = \frac{200,000 \text{ cm}}{D} \text{ seconds}$$

$$\alpha = \frac{2 \text{ km}}{D} \text{ seconds}$$

α	D
4"	1/2 km
2"	1 km
1"	2 km
0.1"	20 km
0.01"	200 km
0"	infinity

Hipparcos

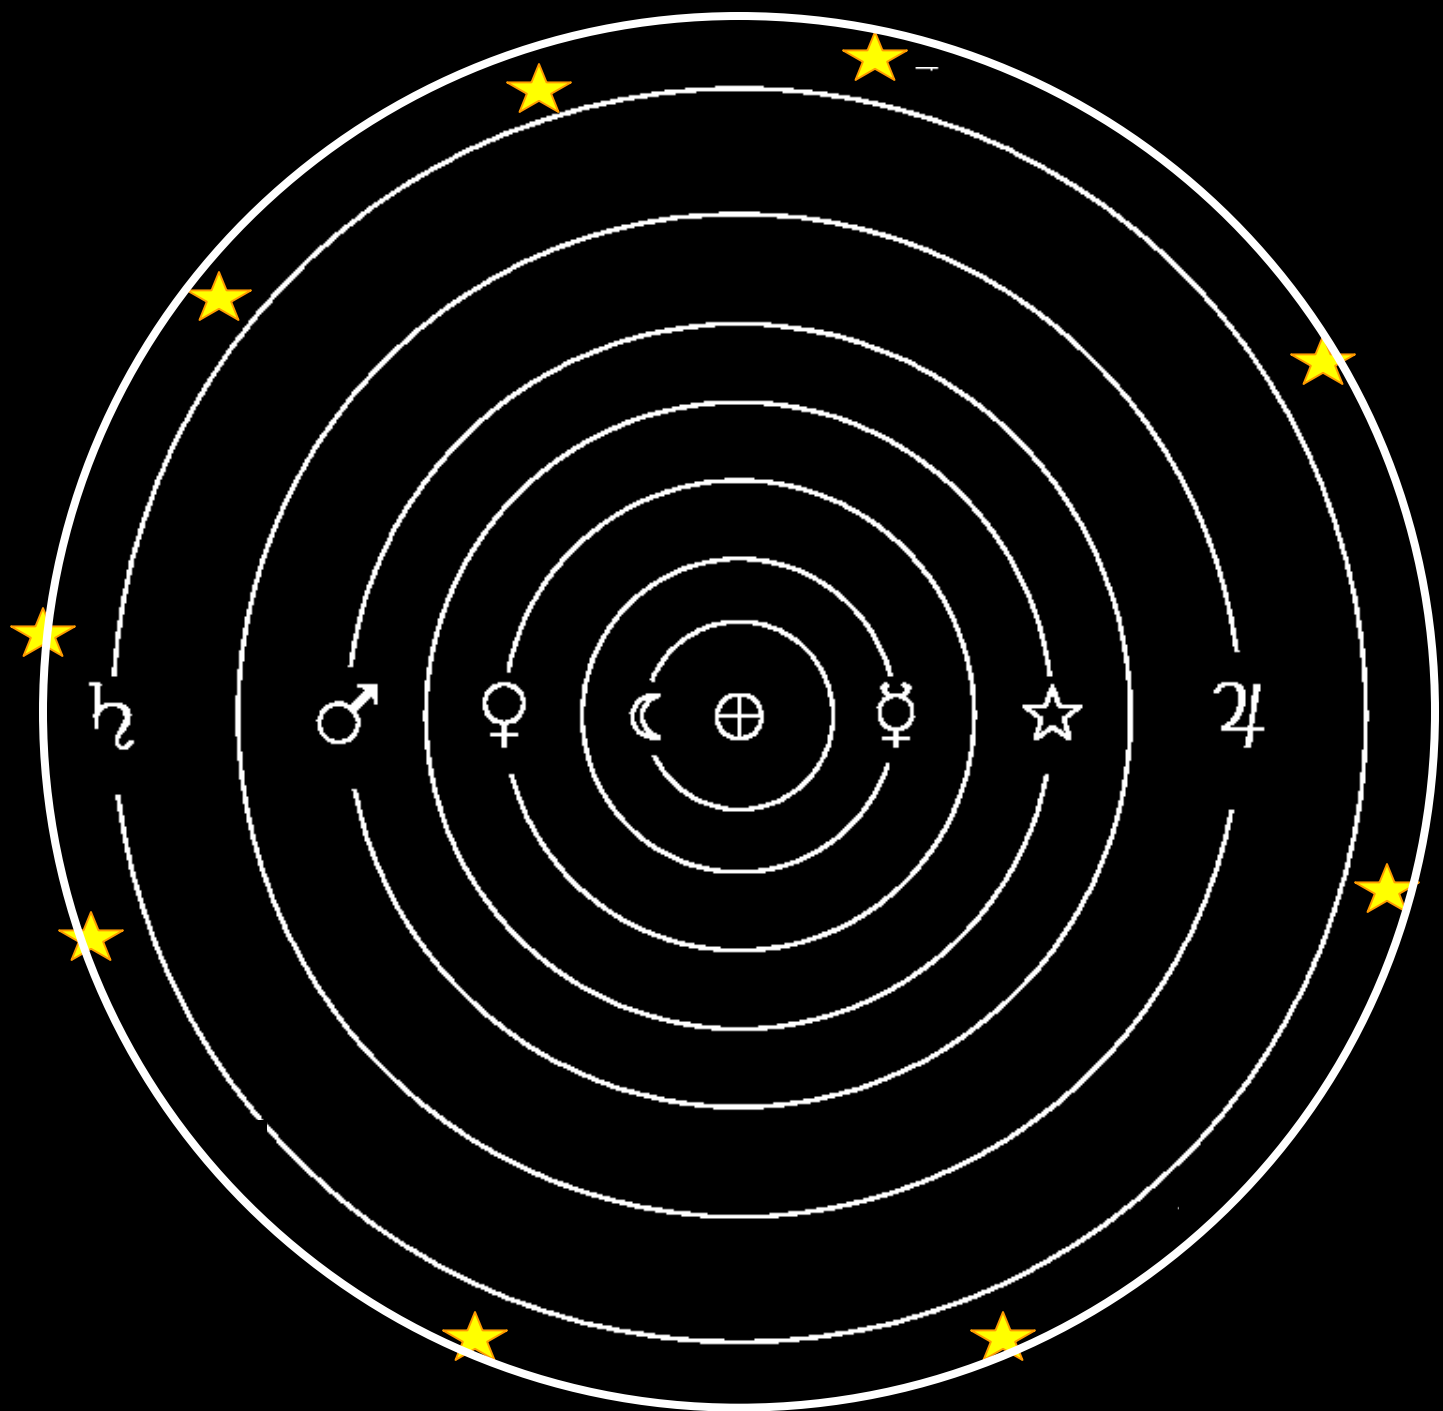

Planet Imager

**Formation
Flying**

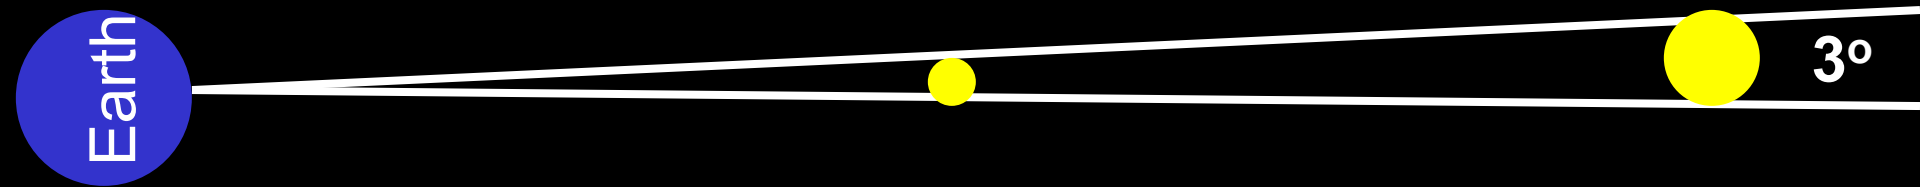

Launch: 2030

**32 X 8 meter mirrors
Baseline = 6000 km**

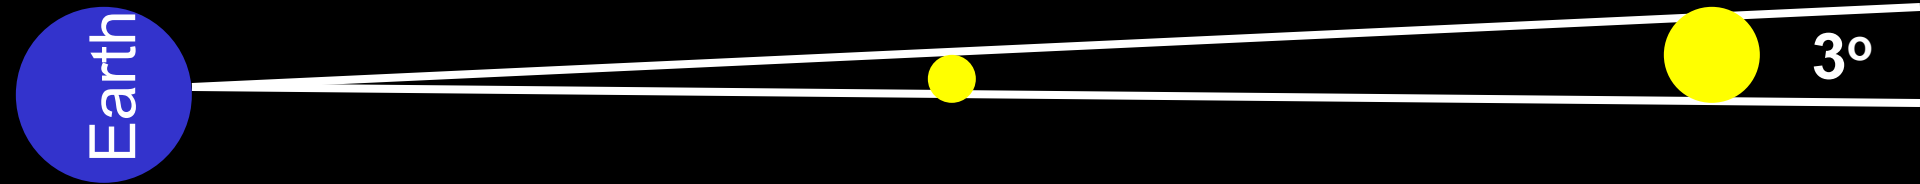

Planet	angular diameter (in minutes)	
	Ptolemy	True
Mercury	2	0.01
Venus	3	0.5
Mars	1.5	0.15
Jupiter	2.5	0.4
Saturn	1.7	0.2
Bright stars	1.5	~0

How far away are stars? How big are stars?

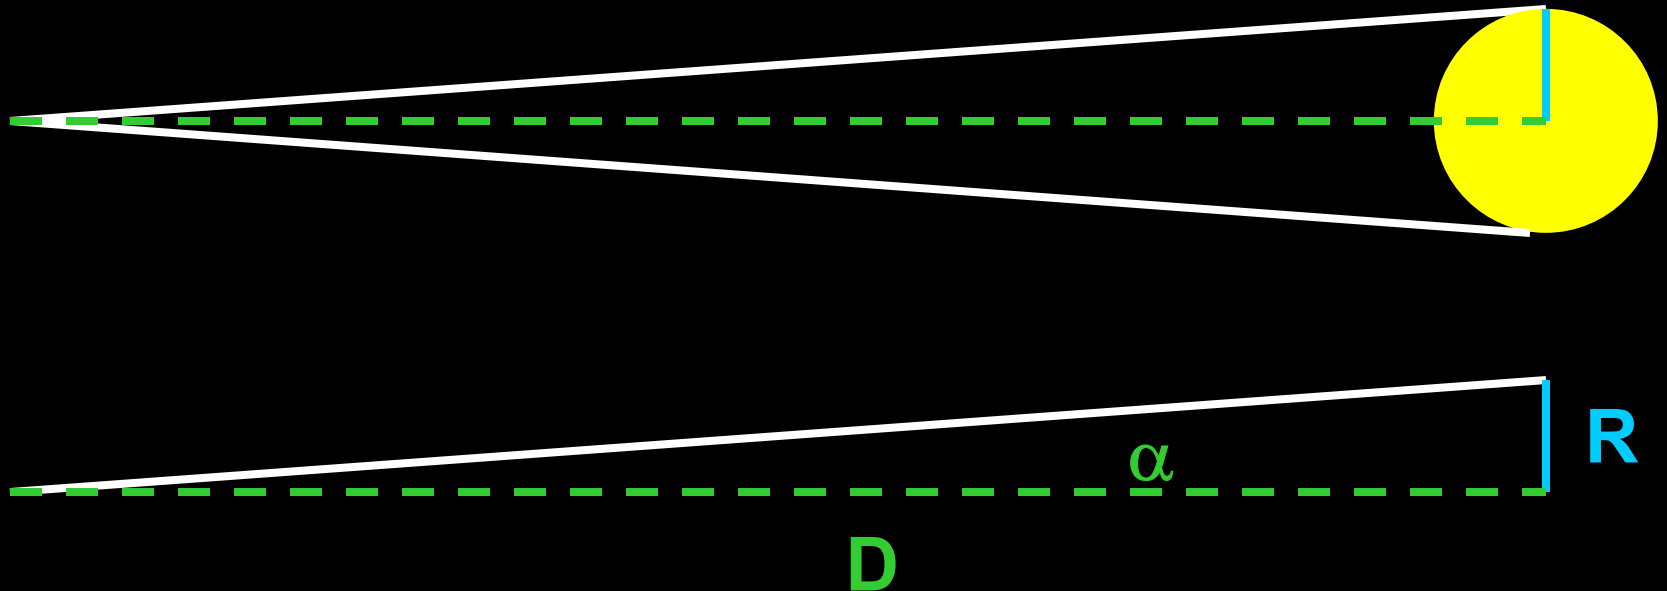

Both objects have an angular diameter of 3°

How far away are stars? How big are stars?

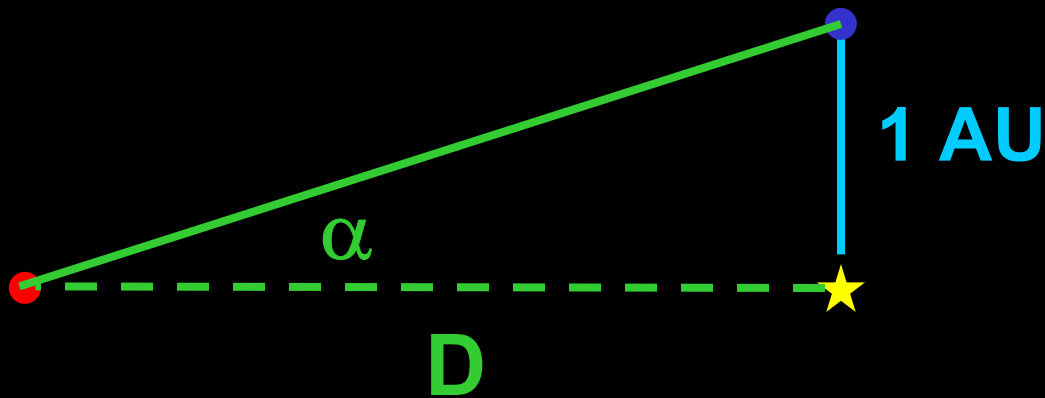

Both objects have an angular diameter of 3°

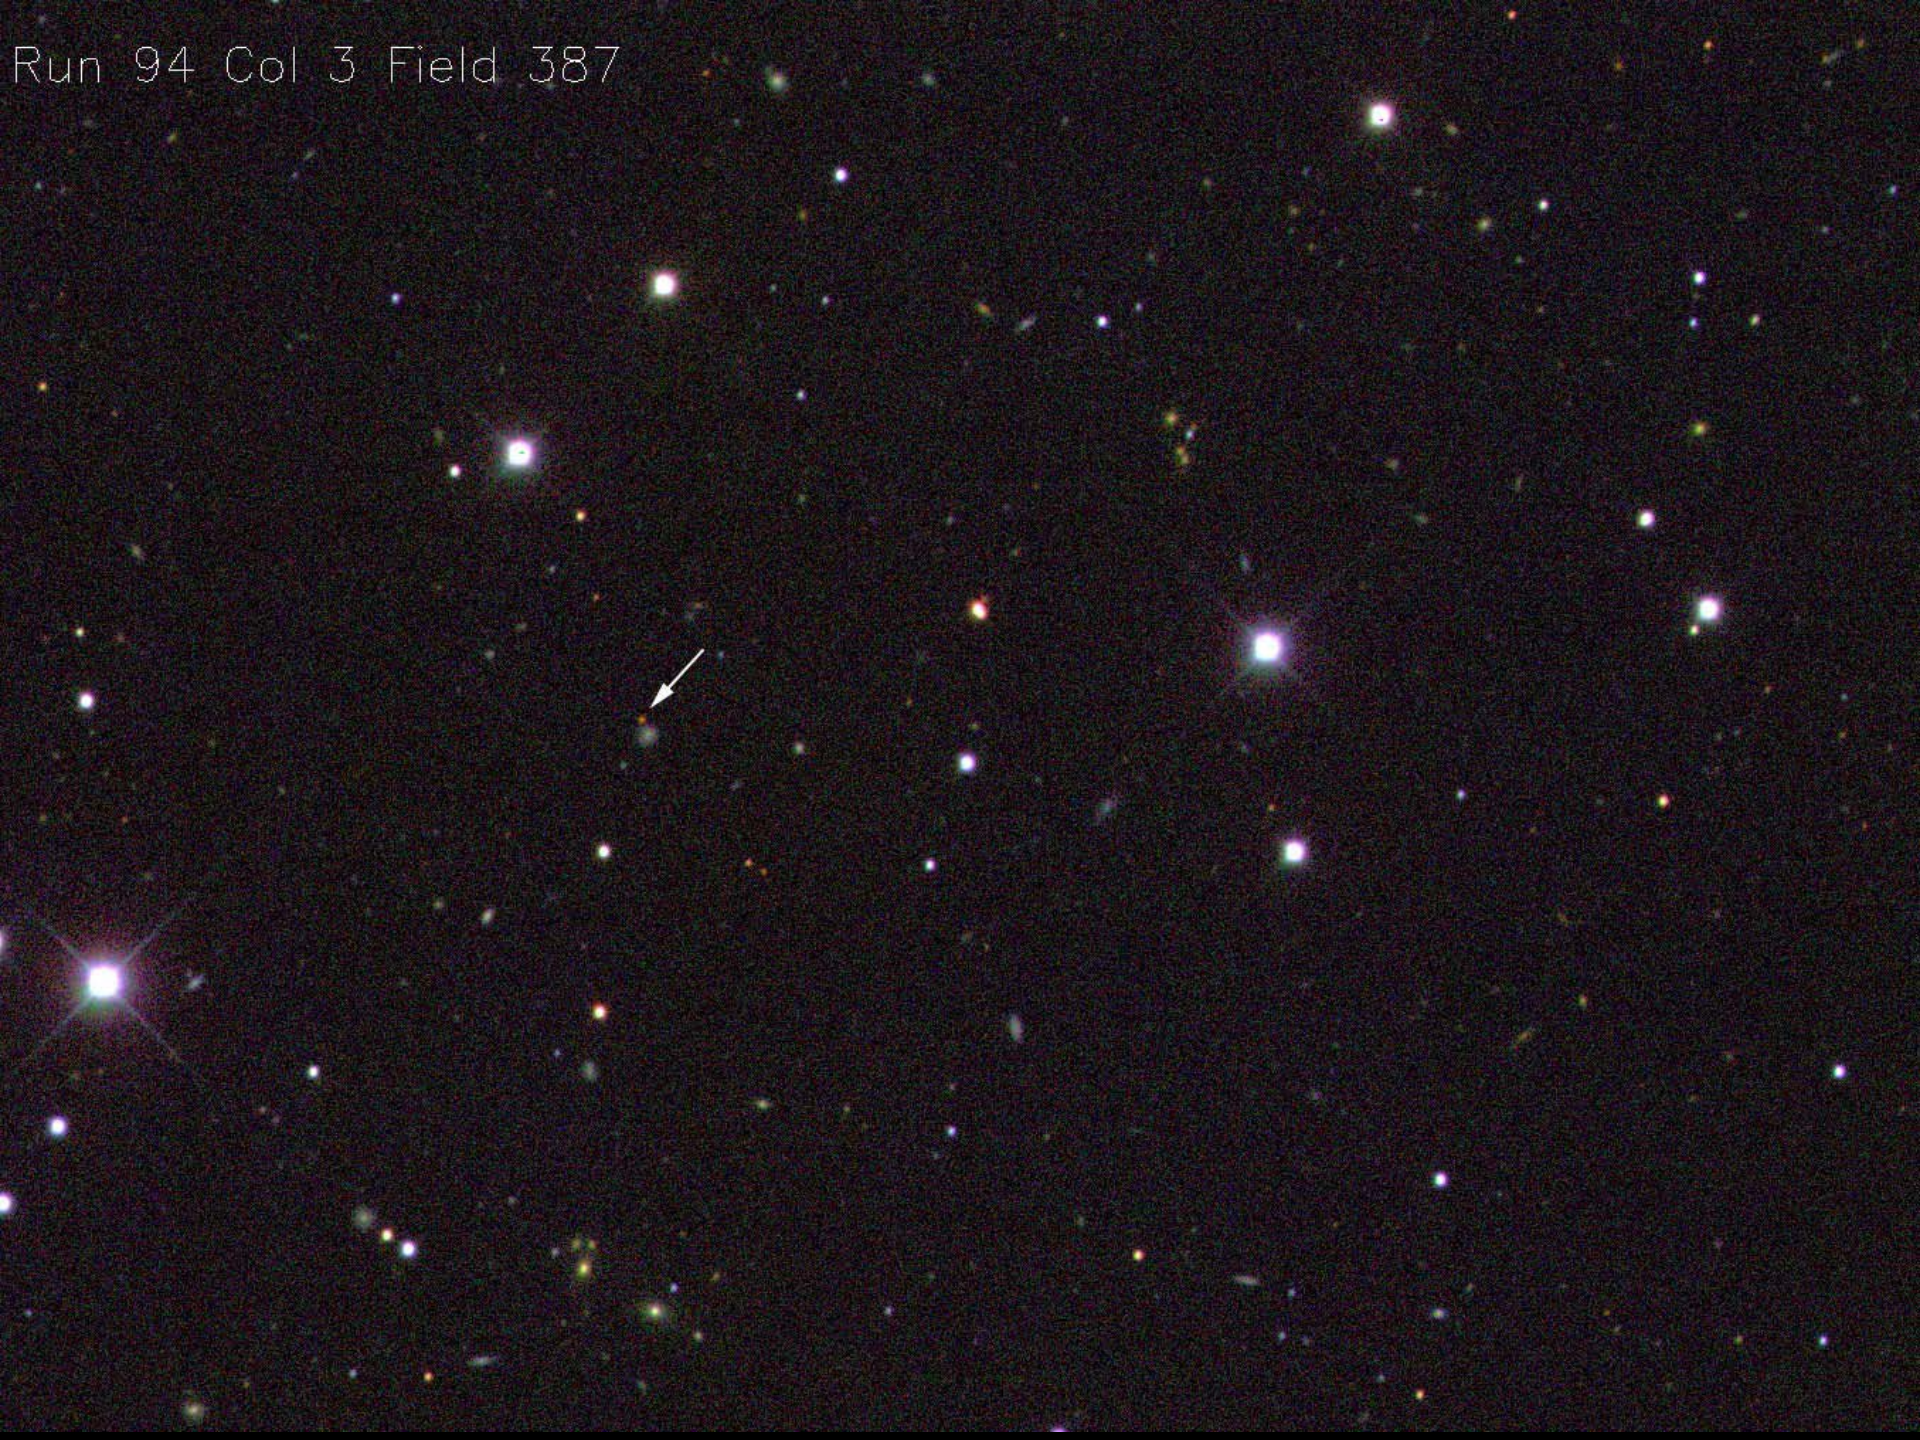

$$\frac{D}{\text{pc}} = \frac{\text{seconds}}{\text{parallax}}$$

$$\frac{D}{200,000 \text{ AU}} = \frac{\text{seconds}}{\text{parallax}}$$

Run 94 Col 3 Field 387

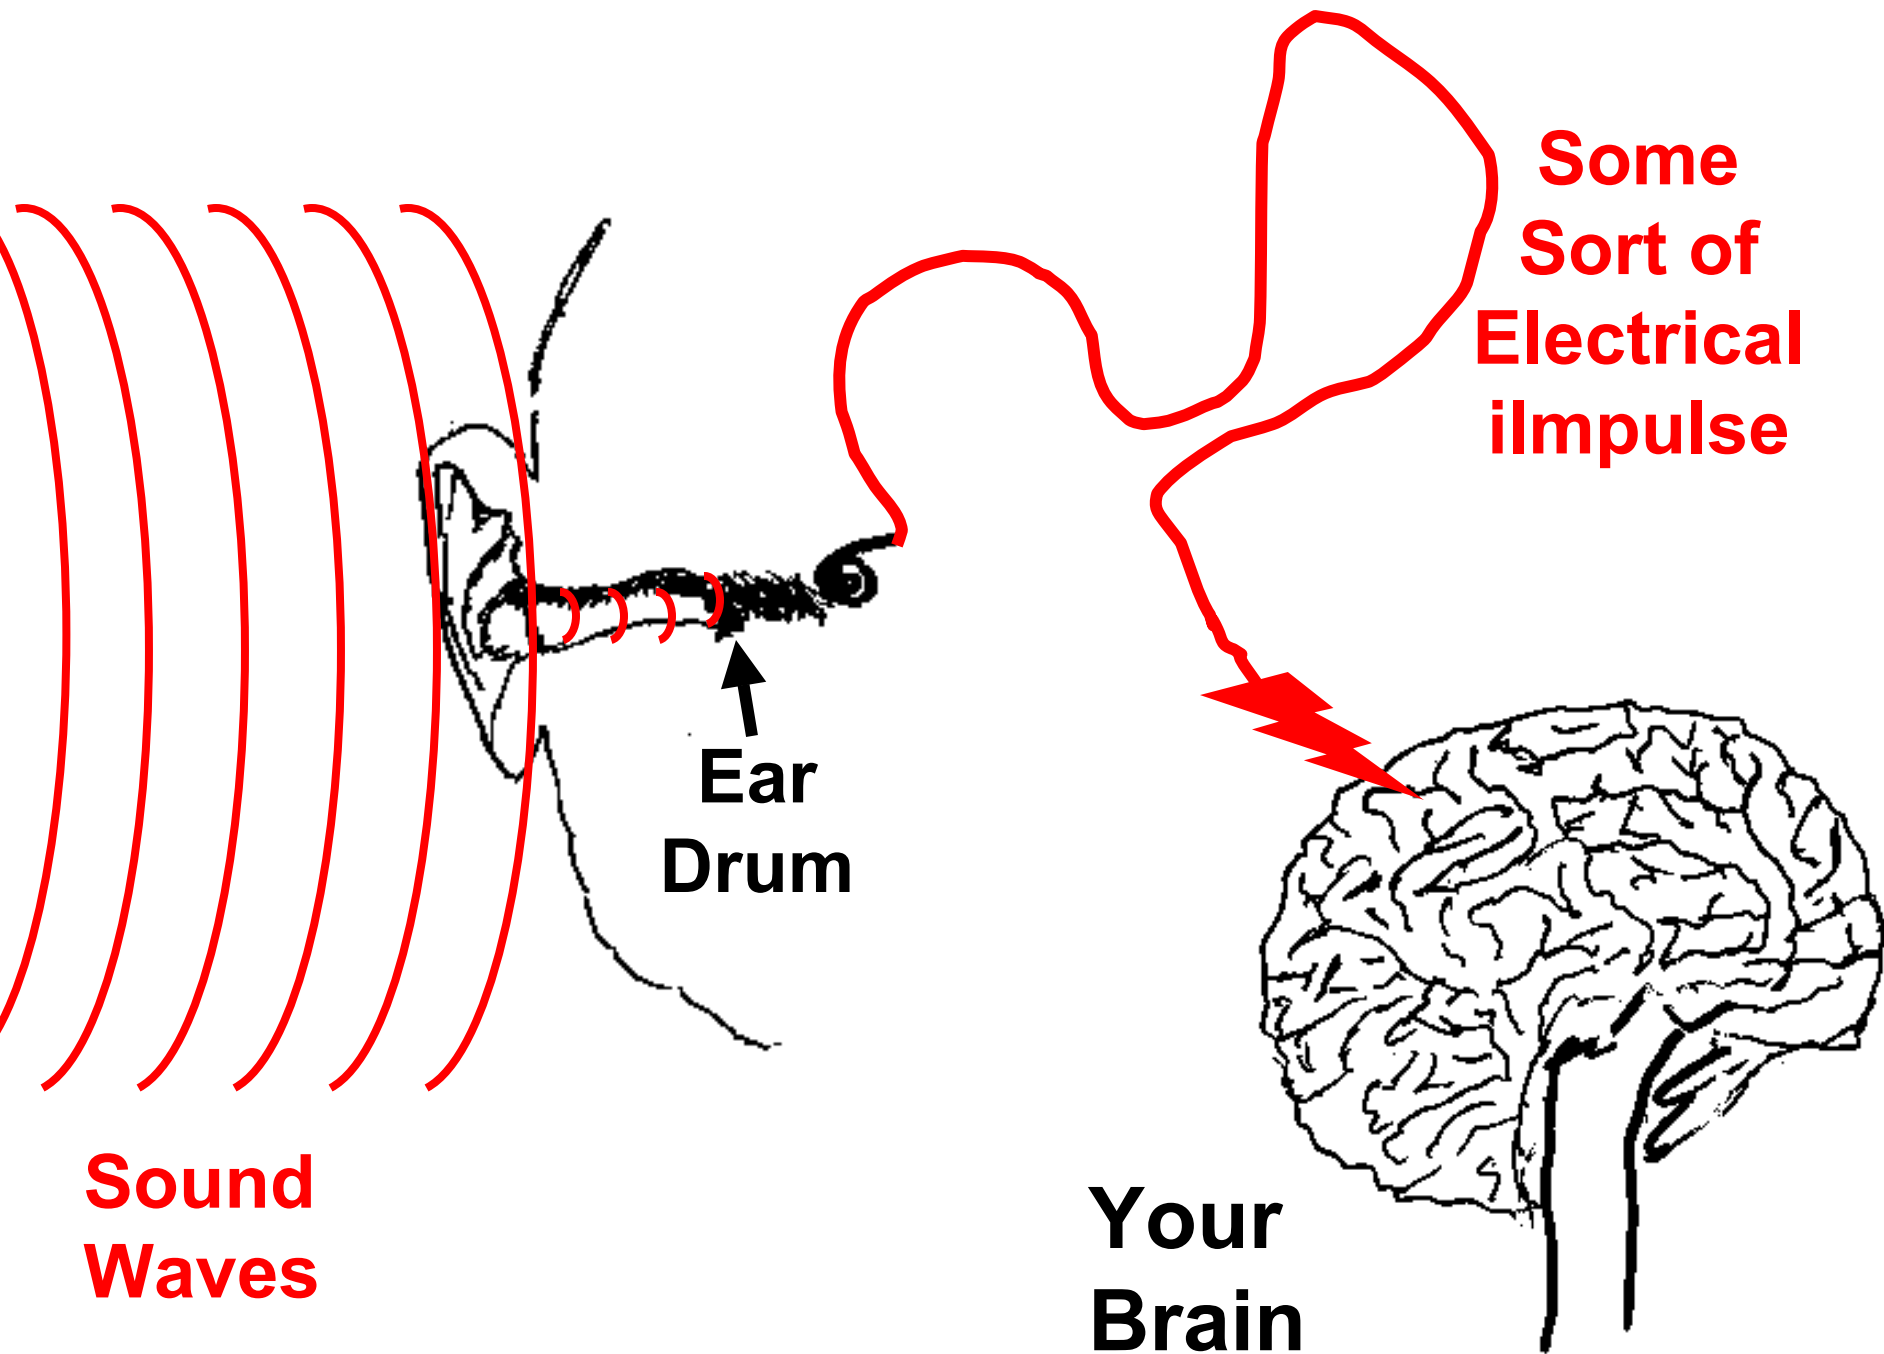

They have different apparent brightness

They have different colors

They move

They change in brightness

$L_{\text{THRESHOLD}}$ = energy per second in ear
at threshold of hearing

L_{PAIN} = energy per second in ear
at threshold of pain

$$L_{\text{PAIN}} / L_{\text{THRESHOLD}} = 10^{12} !!!$$

1 – 100 (10^2)

100 – 1,000 (10^3)

1,000 – 1,000,000 (10^6)

1,000,000 – 1,000,000,000 (10^9)

1,000,000,000 – 1,000,000,000,000 (10^{12})

I/I_0	$\log (I/ I_0)$	$\text{dB} = 10 \log (I/ I_0)$
10^{-2}	-2	-20
1	0	0
10	2	20
10	6	60
10	12	120
10	20	200

Difference of about 1 dB is the smallest change that can be noticed by the human ear

Intensity: energy per time per area

$$I = \frac{\text{Energy}}{\text{Time Area}}$$

$\frac{\text{Energy}}{\text{Time}}$ can be measured in watts

Area can be measured in cm²

Intensity in watts per cm²

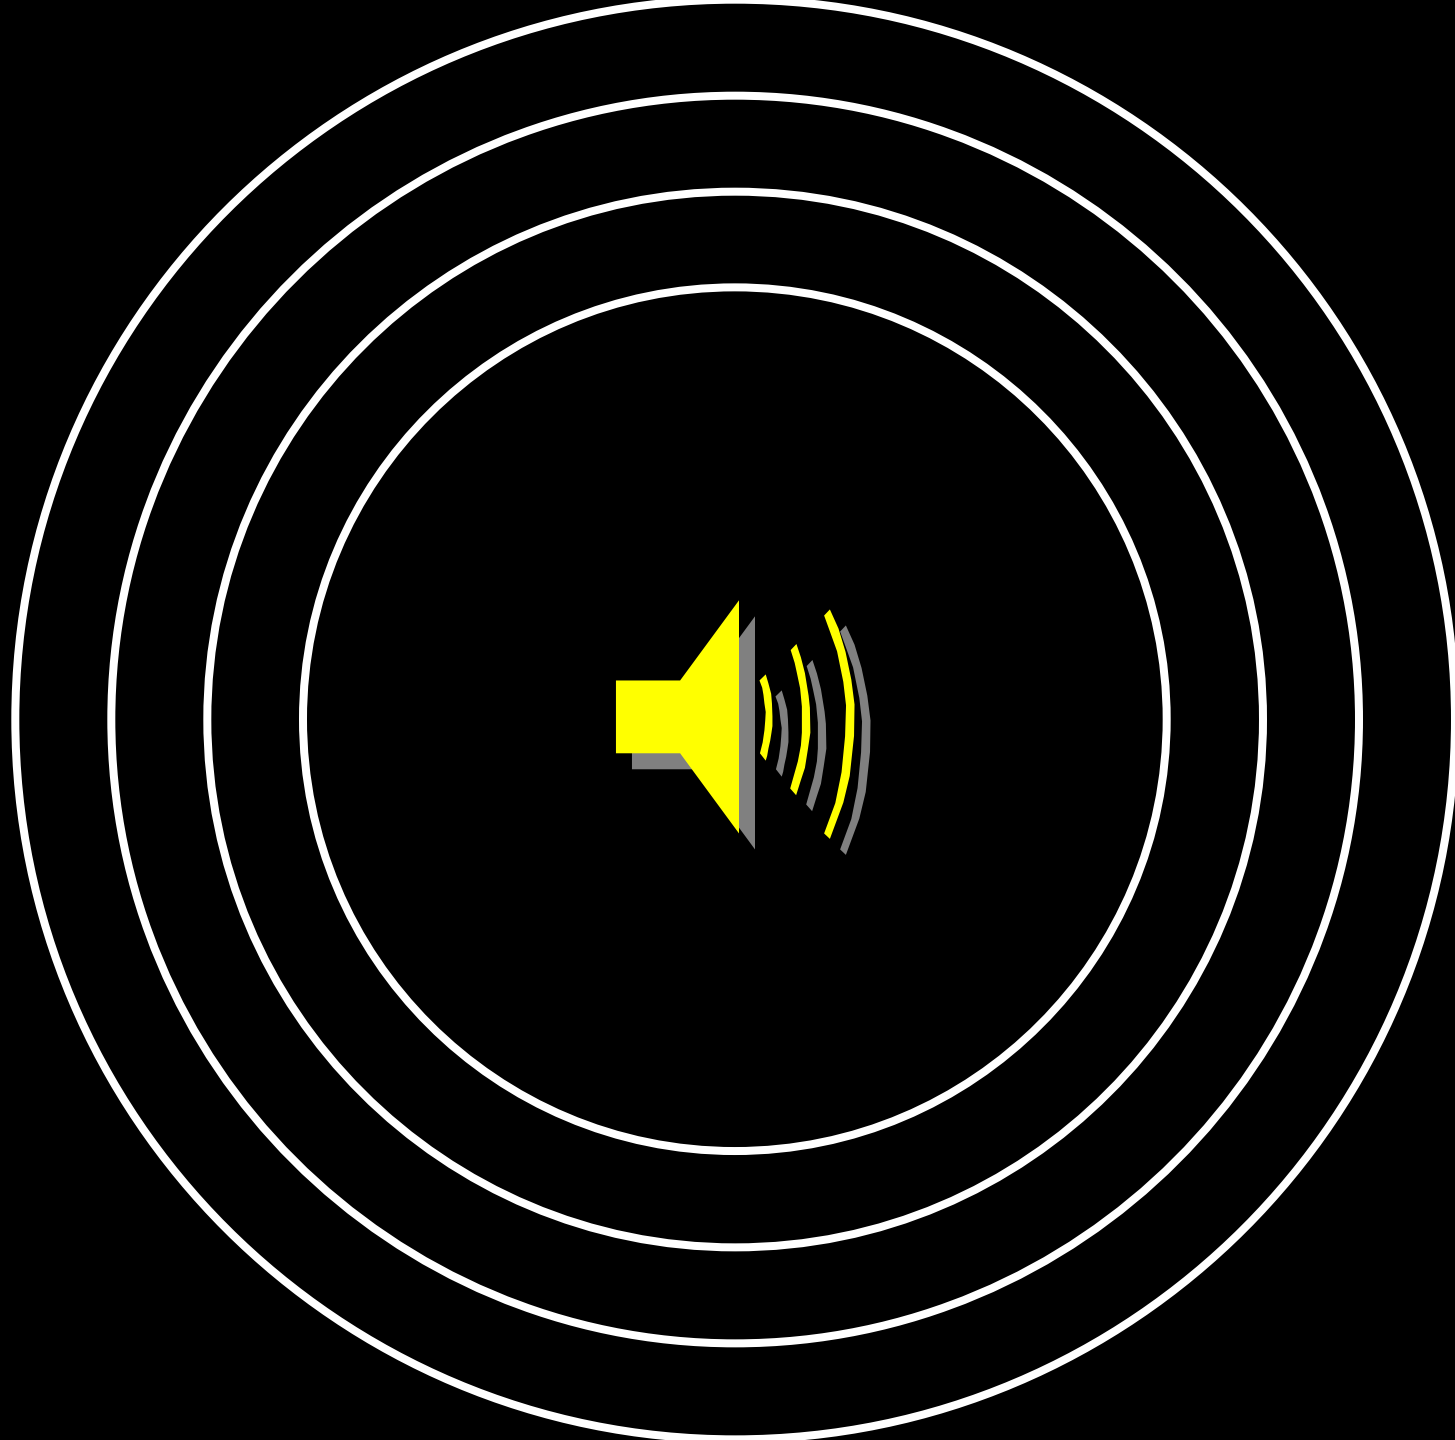

Intensity: energy per time per area

$$I = \frac{\text{watts}}{\text{cm}^2}$$

Power (watts) property of source

**Intensity depends on power
and distance between
source and detector**

$$\text{Intensity} = \frac{\text{power}}{4\pi R^2}$$

Intensity: energy per time per area

$$I = \frac{\text{Energy}}{\text{Time Area}}$$

Energy (Luminosity)
Time can be measured in watts

Area can be measured in cm²

Intensity in watts per cm²

$$L_{\text{SUN}} = 4 \times 10^{26} \text{ W}$$

Intensity: energy per time per area

**Luminosity (watts) property of
source**

**Intensity depends on luminosity
and distance between
source and detector**

$$\text{Intensity} = \frac{\text{Luminosity}}{4\pi R^2}$$

LET THERE BE LIGHT!

Greeks classified stars into 6 classes,
or magnitudes

Brightest stars were 1st magnitude

Dimmest stars were 6th magnitude

Eyes, like ears, are logarithmic detectors.

Intensity of brightest stars = 100 X dimmest.

Some Magnitudes

Sun	$m = -26.8$
Venus	$m = -4$
Sirius	$m = -1.5$
Naked eye limit	$m = 6$
Binoculars	$m = 10$
Pluto	$m = 15$
Large telescope (visual)	$m = 20$
Large telescope (photograph/ccd)	$m = 25$

**Our Sun ain't the
brightest bulb in the box!**

$$L_{\text{SIRIUS}} = 25 \times L_{\text{SUN}}$$

$$\text{Intensity} = \frac{\text{Luminosity}}{4\pi R^2}$$

For stars we know distance to via parallax:

Measure	Distance (R)	→	Know Luminosity
Measure	Intensity		

$$\frac{d}{\text{pc}} = \frac{''}{\text{parallax}}$$

star	parallax (")	distance (pc)	apparent magnitude	luminosity (solar)
α Centauri	0.75	1.3	0	1.5
Barnard's star	0.5	2.0	9.5	0.0005
Sirius	0.4	2.5	-1.5	25
Altair	0.2	5.0	0.8	10

$$\text{Intensity} = \frac{\text{Luminosity}}{4\pi R^2}$$

For stars we know Luminosity:

Measure	Luminosity	→	Know Distance
Measure	Intensity		

They have different colors
